

Chicken King's Vault

Static browser game vault with a landing page, searchable catalog, and many individual HTML game wrappers.

Repo summary
1 page

Evidence date:
2026-04-06

What It Is

A static website called Chicken King's Vault that presents a curated browser-playable game collection. The repo includes a home page, a full catalog page, and many packaged game pages/assets served directly as static files.

Who It's For

Primary persona: players who want a large, no-install browser game library they can browse and launch quickly from one site.

What It Does

- Shows a branded home page with featured games and a CTA to browse the catalog.
- Lists **726** games in the main catalog UI.
- Lets users search titles client-side as they type.
- Supports genre filtering across categories like Action, Platformer, RPG, Puzzle, and more.
- Supports A-Z and Z-A sorting for visible games.
- Displays cover art and links each card to a dedicated HTML game page.
- Includes Vercel analytics wiring and AdSense script tags in the top-level pages.

How It Works

- **Entry pages:** index.html is the landing page; gamepage.html is the full catalog.
- **Catalog data:** game entries are hardcoded as anchor cards in gamepage.html, each pointing to a game HTML file and thumbnail.
- **Client logic:** inline JavaScript in gamepage.html applies search, filter, count updates, and A-Z/Z-A sorting in the browser.
- **Game delivery:** many standalone HTML pages load local assets and packaged runtimes such as Construct scripts, Unity WebGL builds, and media folders.
- **Hosting/ops:** .vercel/project.json shows the repo is linked to a Vercel project; /_vercel/insights/script.js is referenced for analytics.
- **Offline:** service worker registration helper exists in scripts/register-sw.js, but **sw.js not found in repo**.

How To Run

- Open the repo root for the site: chickenkingsvault/chickenkingsvault.
- No package.json or build pipeline was found in repo; this appears to be a static site.
- Serve the folder with a simple static server, for example: python -m http.server 8000.
- Open http://localhost:8000/index.html to start.
- Alternative: deploy/preview as a static project on Vercel using the existing project link. Exact Vercel build settings were not found in repo.

Evidence used: README.md, index.html, gamepage.html, .vercel/project.json, scripts/register-sw.js, scripts/offlineclient.js, and repository file layout.
